

Case Study

Rapid entry into the fixed broadband market enabled by Amdocs Intelligence Networking Suite

About the customer

A new entrant in the EMEA fixed-line broadband market.

Rapid market entry via infrastructure sharing

The service provider made a strategic decision to move rapidly into the fixed-line broadband market. The plan centered on taking advantage of a virtual unbundled local access (VULA) initiative in the target country. This would enable quick entry into the local market while minimizing CAPEX and enabling a very competitively priced broadband offering to consumers. The service provider signed an agreement with multiple wholesalers, to offer broadband services over their existing last-mile FTTH infrastructure. With wholesale agreements in place, the service provider embarked on a rapid journey to deploy its core network infrastructure and go-live.

Needed: a highly advanced OSS

To execute its strategy, the customer knew it needed to deploy an advanced OSS that would provide automated order to activation (O2A), including seamless, lights-out interaction with the OSS of multiple third-party, last-mile fiber infrastructure providers. The solution would need to perform accurate feasibility checks, reservation of partner fiber infrastructure, automatic service activation, and closed-loop service assurance.

Amdocs selected

Amdocs was chosen to provide and deploy the OSS, including the interfaces with fiber infrastructure providers.

OSS on the cloud for rapid deployment

The service provider chose Amdocs SaaS OSS deployment model, together with Amdocs Managed Services. The service provider's OSS is hosted on a private cloud in Amdocs datacenters, and is operated by Amdocs as a managed service. This enabled accelerated project delivery, with a very high level of agility and quality, while minimizing OPEX and CAPEX.

Project highlights

100% reuse of third-party last-mile fiber infrastructure.

Tight integration with third-party OSS, cloud-based CPE gateways and domain controllers, enables end-to-end automation of order feasibility check, fulfillment, activation, and service assurance.

Zero-touch CPE: automated, closed-loop service assurance resolves most CPE faults automatically.

Network inventory system enables automated fulfillment and assurance by providing comprehensive, accurate multilayer data about the end-to-end physical network underlay and service overlay.

Plug and play: interface to third-party fiber infrastructure providers is totally modular so new fiber suppliers can be onboarded as needed.

Cloud-based OSS delivered as SaaS: the OSS is hosted in Amdocs datacenters, and operated by Amdocs as a managed service for unprecedented scalability, flexibility and reliability.

Fully scalable: OSS solution built to handle high subscriber growth rate.

Future-proof: OSS ability to manage both physical and virtual network functions, as well as 5G, enables roll-out of innovative service offerings.

Full-stack

The deployed OSS includes Amdocs Network Inventory, which provides comprehensive resource management of the physical and logical network underlay and comprehensive service management of the service overlay. The solution also includes Amdocs Inventory Workflow Manager for network change execution and management, Amdocs Service Orchestration, and Amdocs Service Activation for service fulfillment automation, as well as TEOCO's Helix Fault Management for closed-loop service assurance. Amdocs also delivered critical interfaces between the service provider's OSS and the OSS of each fiber infrastructure provider.

A deep resource model

Amdocs Network Inventory describes the supporting logical and physical network underlays, including the switches, network gateways, NAT appliances, aggregation, residential gateway CPE, as well as the fiber and pots terminations that make up the end-to-end subscriber connections. Amdocs service inventory describes the end-to-end subscriber service connection with pointers to the supporting network infrastructure.

Amdocs Service Orchestration

Amdocs Service Orchestration leverages the detailed inventory data to automatically provision subscriber services including automatic selection and activation of the relevant third-party fiber infrastructure.

Challenge met

Amdocs deployed highly efficient and automated order to activation processes that automatically fulfill broadband service orders over the third-party fiber infrastructure at the edge.

CPE integration

The OSS deployment included integration of the service provider's gateway software to the OSS. The CPE functionality is cloud-based, and the OSS has been fully integrated with the gateway to enable end-to-end fulfillment including CPE configuration, activation, as well as automatic fault detection and resolution

Accelerated service assurance

When service faults or degradations occur, the service assurance system extracts end-to-end service and network infrastructure data from the inventory system, enabling accelerated root-cause analysis and fault resolution.

Best-practice workflows

A key element of the successful project implementation was the creation and dissemination of best-practice workflows, tight process governance, and SLA's spanning across the service provider organization and 3rd party fiber infrastructure providers.

On the cloud

The OSS is cloud-based and delivered as SaaS: the OSS is hosted in Amdocs datacenters, and operated by Amdocs as a managed service for unprecedented scalability, flexibility and reliability.

Dramatic business value – faster time to market and reduced deployment costs

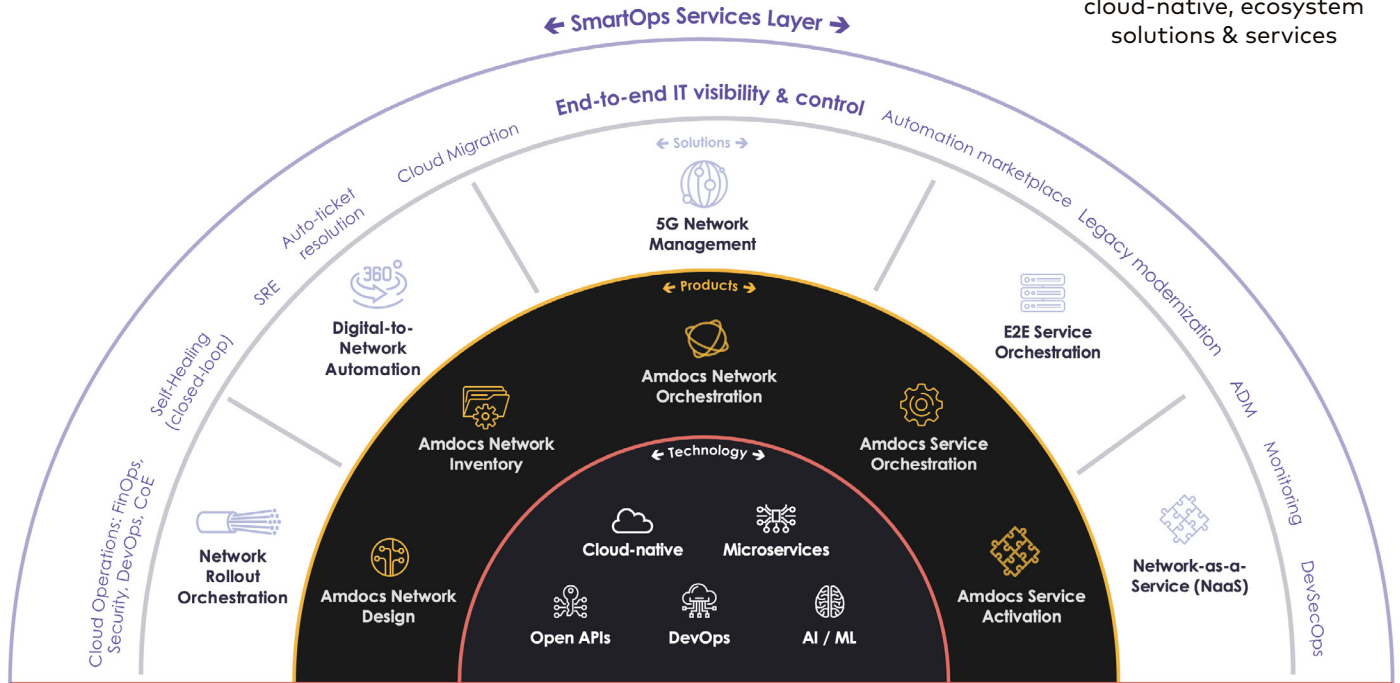

The service provider was able to launch its FTTH service in record time with reduced CAPEX and OPEX. With dedicated teamwork by Amdocs and internal service provider teams, the project was deployed on schedule, with minimal impact from COVID-19.

Future-proof

Amdocs OSS is modular, and positions the service provider with a flexible, scalable, and upgradeable platform that supports new technologies and business opportunities such as network virtualization, 5G fixed wireless access and 5G network slicing.

Amdocs Intelligent Networking Suite

Driving automation for the era of hybrid & open cloud networks with digital, open, cloud-native, ecosystem solutions & services

A key objective for Amdocs is to help service providers modernize, consolidate and transform their service and network management systems to realize a modular, cloud-native management solution approach. Amdocs has evolved its proven capabilities into Amdocs Intelligent Networking Suite designed to manage and orchestrate hybrid networks, combining traditional service fulfillment functionality with cloud and NFV orchestration and automation capabilities.

Contact [Amdocs Network Marketing](#).

Amdocs helps those who build the future to make it amazing. With our market-leading portfolio of software products and services, we unlock our customers' innovative potential, empowering them to provide next-generation communication and media experiences for both the individual end user and large enterprise customers. Our 28,000 employees around the globe are here to accelerate service providers' migration to the cloud, enable them to differentiate in the 5G era, and digitalize and automate their operations.

Listed on the NASDAQ Global Select Market, Amdocs had revenue of \$4.3 billion in fiscal 2021.
